1. The PDB Database

The main repository of biomolecular structure data is called the PDB found at: https://www.rcsb.org/

Let's see what this database contains. I went to PDB > Analyze > PDB Statistics > By Exp method and molecular type.

```
pdbstats<- read.csv("Data Export Summary.csv")
pdbstats
```

```
           Molecular.Type   X.ray     EM    NMR Multiple.methods Neutron Other
1          Protein (only) 169,563 16,774 12,578              208      81    32
2 Protein/Oligosaccharide   9,939  2,839     34                8       2     0

```
5     213
6      22
```

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
pdbstats$X.ray
```

```
[1] "169,563" "9,939"   "8,801"   "2,890"   "170"     "11"
```

The comma in these numbers is causing them to be read as characters rather than numeric. I can fix this by replacing "," for nothing "" with the `sub()` function:

```
x <-pdbstats$X.ray
sum(as.numeric(sub(",","", x)))
```

```
[1] 191374
```

Or I can use the **readr** package and the `read_csv()` fucntion.

```
library(readr)
pdbstats<- read_csv("Data Export Summary.csv")
```

```

Q2: What proportion of structures in the PDB are protein?

```
(sum(df[1:3, "total"]))/(sum(df$total))*100
```

```
[1] 97.91585
```

Answer: The portion of structures in the PDB protein structure are 97.9%.

> Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

2. Using Mol*

The main homepage at: https://molstar.org/viewer/. We can input our own PDB files or just give it a PDB database accession code (4letter pdb code).

3. Introduction to Bio3D in R

We can use **bio3d** package for structural bioinformatics to read PDB data into R

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```

 Call:  read.pdb(file = "1hsg")
```

4. Predicting functional dynamics

We can use the `nma()` function in bio3d to predict the large scale fucntional motions of biomolecules.

```
adk <-read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
